Theorem (This is a theorem)

Let S be the set of all university students. For $\forall s \in S$, we have $H(A \mid \text{Graduate}) \geq H(A \mid \text{Not Graduate})$ where $H : S \rightarrow \Omega$ is an injection from the set of all students S onto the set of all health outcomes Ω .

Using This Template

This theme is **modular**: the same source renders at both aspect ratios. Only the `aspectratio` option in `\documentclass` changes — the layout adapts automatically.

- **4:3** (CEL native):
`\documentclass[aspectratio=43]{beamer}`
- **16:9** (widescreen):
`\documentclass[aspectratio=169]{beamer}`

These two preview PDFs were built from one shared body:

- `caedlab_theme_test.pdf` — 4:3
- `caedlab_theme_test_169.pdf` — 16:9

Thank you!
